Wir machen uns Gedanken

This picture absorbs noise.

Room quality is considerably defined by these parameters: Functionality and the so-called feel good factor. While the former can be verified with objective criteria, the „feel good“ factor is a subjective, emotional feeling.

To a large extent, room acoustics affect both areas. They are objectively measurable and subjectively, they are able to be experienced. But unfortunately, room acoustics often first become the focus of the users when something becomes aggravating. Disturbing noises as well as too high or too low voice articulation impair the concentration and make understanding difficult. However, a room demonstrates its quality also as a place for communicating. If this awareness comes too late, corrections are often difficult and expensive. Modern materials, a convincing concept and our long-standing experience are the components of Muhlack's acoustic pictures. Numerous references from home and abroad prove the following: Without structural changes, you can quite specifically reach a lasting and cost-efficient improvement of your room acoustics.

Decorate your room visually and acoustically: With Muhlack acoustic pictures and our unlimited choice of motifs.

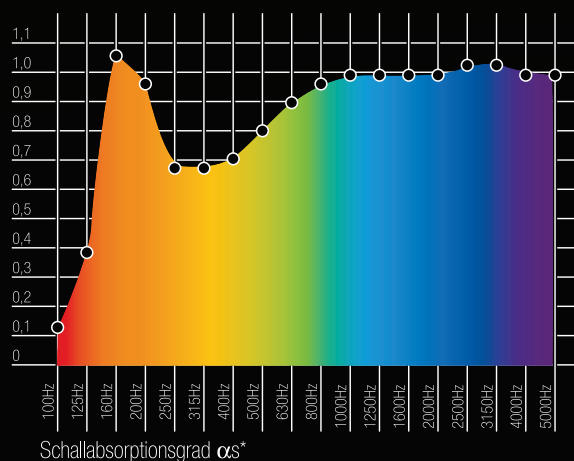

Suspended acoustic pictures printed on both sides for interior decorating; they minimise sound propagation and reduce the reverberation time.

Technical details

The acoustic picture was specifically developed for the human vocal range and is highly effective, even in problematic, low frequencies. With a neutral covering, it can be integrated into every room thanks to its low depth; it can also be used as an attractive eye-catcher. Free-standing wall elements, sliding panels, and even curved designs are possible as absorbers. The acoustic picture is a frame construction and its specially developed layers absorb very high and very low frequencies. The surface covering consists of plain-coloured or digitally printed mesh. Your choice of fabric is also available upon request. The absorption layers and mesh coverings are B1 certified, robust, dimensionally stable and easy to clean. The Muhlack acoustic pictures feature

- Outstanding sound absorption with broad band effectiveness
- Easy installation
- Variable sizes
- Mobility
- Individual images
- Multifunctionality
- Colour consistency extending over many years
- Colour brilliance and 100% reproduction of defined colours
- Robust, heavy duty and easy-care design

* The equivalent absorption area was measured. The sound absorption coefficient was determined mathematically. Absorption class B according to DIN EN ISO 11654
SAA value: 0.85
